

From the partial shard to the finished city

An imagined sequence of many tiny approved releases, based on the Nine Dragon mega plan (P1-P7).

TODAY - CURRENT PLAYABLE FRAGMENT

Lantern Square at +125 m, a short street and stair, upper Well galleries, a basic playable Fei Zhua zip. Roughly a 100 x 125 m corridor in plan; it does not fill that rectangle.

THE FINISHED DESTINATION

A 500 x 500 x 500 m city with nine distinct, traversable strata; complete routes, combat, life, quests, weather and sound; stable portrait iPhone PWA performance.

The pages that follow are future checkpoints, not a claim that the other eight strata or the full game already exist.

The rule: show one small new piece beside the pinned world. Jake steers its look and feel. The agent checks every angle, plays it, tests the phone, and pins it only when it passes.

Finish line: the city has no inaccessible placeholder districts, no unreviewed model pile, no double loading, and no phone-only failure hidden behind a pretty still.

Release 1: three levels that actually connect

Finish the fragment, then make Terrace Row (5), Lantern Square (6), and Cable Deck (7) one playable route.

IMAGINED SEQUENCE

First we fix the double-load cause and finish the Fei Zhua bite, line, miss and landing. We polish the eight existing domes and run the real iPhone gate. Then we add one Terrace stair and one Cable Deck arrival - not their whole districts.

Jake sees a portrait target / current / next board and a 20-second crossing. He says, "The upper deck looks like another square; give it cableway scale." We change that one view and replay the route.

Pin only when the three levels feel different, the player can travel both ways, the Explorer models are inspectable, and the physical phone stays stable.

Release 2: nine levels in a safe greybox

The 500 m structure arrives as routes and collision first; rough districts remain behind the review boundary.

9 Crown	+250 m
8 Antenna Forest	+210 m
7 Cable Deck	+165 m
6 Lantern Square	+125 m
5 Terrace Row	+70 m
4 Old Street	0 m
3 Rail Cut	-70 m
2 Shelter Market	-150 m
1 Sump	-250 m

THE ACTUAL BUILD ORDER

A vertical-extent field, height streaming, multi-layer navmesh, per-level map and lights make the cube viable. Greybox the full Well, four Light Wells, lifts, gates, cliff faces, highway, monorail path and fall catches.

Jake tests one new route at a time. The agent proves zero stuck or escape cases and checks that at least five levels feel like ground from a standing eye. A level remains gated until its route works.

This milestone is a connected skeleton, not nine polished districts. Approved earlier routes remain the public demo; the new greybox is exposed only for review.

Release 3: turn the skeleton into a city

For each hero space: portrait mockups, two domes, nine-angle targets, playable loop, phone gate, one decision.

OLD STREET CONCEPT

CROWN CONCEPT

MARKET CONCEPT

IMAGINED REVIEW RHYTHM

WAVE 1 - NEARBY

Finish 6, 5, 7: north street, terraces, cableway stations.

Gate: three distinct ground-level views and a reliable route.

WAVE 2 - CONTRAST

Build 4, 8, 9: dark alleys, shanty roofs, open Crown.

Gate: each level has its own silhouette, light and approved models.

WAVE 3 - DEPTH

Build 3, 2, 1: train cut, shelter market, flooded Sump.

Gate: the lower colour flip and Well depth read in motion.

The agent keeps the nine-view comparisons internally. Jake gets one portrait board and one taste decision per pocket - never nine floors of variants at once.

Release 4: life, story, combat - then ship

The city is finished only when its systems and the physical iPhone pass, not when the last still looks good.

FULL SLAB CONCEPT - FINISH-LINE TARGET, NOT GAMEPLAY

LIFE AND COMBAT

Crowds, fauna, Tong, Jiangshi, drones, elites and the Well Dragon.

Gate: combat and animations are readable in play and in Explorer.

QUEST AND ATMOSPHERE

Nine Red Envelopes, lift unlocks, typhoon, nine music arrangements and stratum SFX.

Gate: a full route has purpose, sound and distinct weather.

PHYSICAL IPHONE

All nine levels load and stream within memory and frame budgets; no restart or double load.

Gate: real home-screen PWA playthrough and 60 fps final-game target.

At the end Jake reviews one full portrait playthrough and the final public card. The agent has already cleared collision, model, audio, code, build and phone checks. The lab is archived only after feature parity.
