

A shard built together, one pocket at a time

Fictional review sequence, grounded in the current partial shard. This is a process example, not a claim that these steps shipped.

THE 80 / 20 PROMISE

The square stays playable while we touch only one rough slice: the Fei Zhua crossing. We do not turn a 500 m city into a giant review queue.

When the new slice looks and plays right on iPhone, it joins the pinned area. Only then do we open another pocket.

PINNED / DEMO READY

ONE ACTIVE SLICE

WHAT EXISTS TODAY

The playable fragment is a 22 x 46 m square, a 12 x 94 m street and a stair corridor, plus Well ledges and crossings. The 500 x 500 x 500 m city is the future plan.

Checkpoint 1 - pin the square

One portrait camera. One target. One playable capture. One taste decision.

IMAGINED EXCHANGE

We show the same spawn pose. Jake says the gate and street feel right, but the ground reads too clean. Only wet-stone response is revised; the skyline stays pinned.

INTERNAL CHECKS

Nine camera angles, a slow walk, collisions, 60 fps capture and real iPhone memory are checked by the agent. The user sees one short board and one playable link.

EXIT

Approve the square only after the moving view and phone build agree with the still. Until then, it remains the active 20%.

Checkpoint 2 - make the hook a real verb

The target picture is a taste guide; the lab proves pieces, not a playable crossing.

ONE ACTIVE SLICE

A hook, a line, a pull on the real player capsule and a safe landing. LOCK chooses a visible dragon hook; JUMP fires. Miss and release are part of the same slice.

IMAGINED FIRST PASS

The line fires, but the bite is hard to read and a miss throws the player into the shaft. The rest of the square is still demo-ready. We do not add more hooks yet.

ONE REVIEW QUESTION

Does the lock and bite read clearly while moving? We fix that and the landing before calling this checkpoint polished.

Checkpoint 3 - polish the landing, not a district

The same Well camera is compared again after a tiny geometry and timing pass.

LOOK TARGET

IN-ENGINE VIEW

IMAGINED STEERING

Jake asks for the dragon head to sit a little farther into the view and for the far deck to feel wider. We adjust those two things, then replay the zip and the landing.

NO STILL-IMAGE SHORTCUT

The agent walks and grapples around the rim, checks the other angles internally, then tests the portrait PWA on a real iPhone. A beautiful isolated frame is not the gate.

PIN IT

Only the hook plus landing join the approved area. The rest of the Well stays closed scenery until its own checkpoint.

Checkpoint 4 - test combat before expansion

The next review is a small interaction, not another hundred metres of city.

HUD ARENA MOCKUP

NINE-ANGLE DUMMY SHEET

SHARED PRACTICE ROOM

Before another pocket, review the real first-person arms, light combo, heavy, ranged hit/miss and damage numbers against three animated humanoid dummies. Their armor materials are inspected from all sides.

THE RELEASE GATE

Model Explorer: approved form. World Explorer: approved placement and seam. HUD arena: clear controls and hit feedback. Real iPhone: stable load and frame time. Then commit and deploy.

NEXT SLICE

Only after those gates pass do we propose the next small Nine Dragon dome. The process repeats with one board and one decision.
