

Driftwood Isle

blow by blow

One night, 2026-09-18, 00:20 → 04:23 for the shard, then the trailer and the music by 08:14. Every steering prompt, every mockup, every progress screenshot, every deploy — in order. For Matthew.

The island at 04:23 — an in-engine capture from the pier, now the shard's hero art.

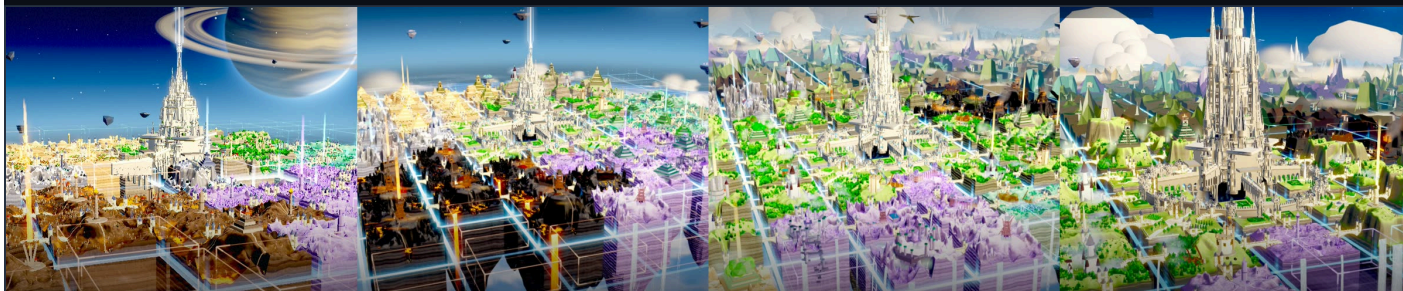

00:20 — the ask

A TEASER CARD, NOTHING ELSE

JAKE · 00:20

We are building driftwood island.

State of the world: Pine Hollow (chunk 001) is playable; Driftwood Isle is a "coming soon" card on the title deck with a toon-style hero image. The engine is per-shard data (`ChunkDef`) + shared systems: terrain, sky, forest, animals with AI, a crossbow, HUD, touch controls, minimap, loading plan, service worker.

The vision, from sources/citadel.mp4: a grid of player-built chunks, highways between them, a citadel, the ringed planet.

JAKE · 00:24

I think this is a great low poly island, Driftwood Island. You want to make a whole bunch of mockups by spawning parallel codex CLI agents. Make me a mockup of the spawn point. Make me a mockup of two or three points of interest. For the spawn point, make me three variants showing three different low poly art styles.

JAKE · 00:27

This island gameplay is different from the pine wood. Pine wood is crossbow, first person; this island is more like Zelda Wind Waker inspired. So I need a couple of mock-ups of what happens when you have...

JAKE · 00:29

In terms of equipment, I'm thinking a basic low poly iron sword, but also a basic low poly wooden sword. Those need completely different animation systems — you just have one animation for the swing; instead of shooting or reloading, swinging the sword. Now that we have equipment, where in the UI will we put equipment? But forget about equipment — first implementation is just a wooden sword. Do the mockups of both. I'll deal with inventory and equipment later.

JAKE · 00:31

We already implemented the boar, which is cool. So let's just do the same boar, but low poly art style. And we'll start there.

00:35 — mockup round 1

EIGHT CODEX IMAGE-GEN RUNS IN PARALLEL · THIRD PERSON (MY MISTAKE)

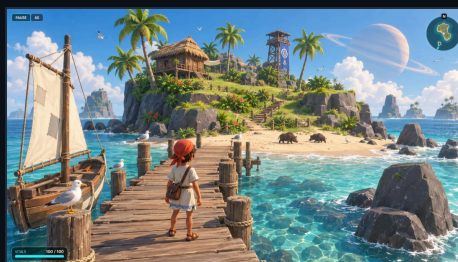

Codex CLI with its built-in image_gen, one prompt per shot, the hero art attached as the style reference. I framed these third-person because "Wind Waker" — Jake corrected that within the hour.

Spawn · style A "cel-shaded toon"

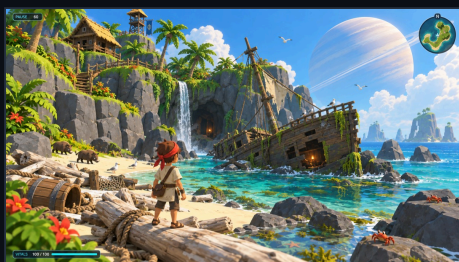

Spawn · style B "faceted flat-shaded"

Spawn · style C "painterly soft low-poly"

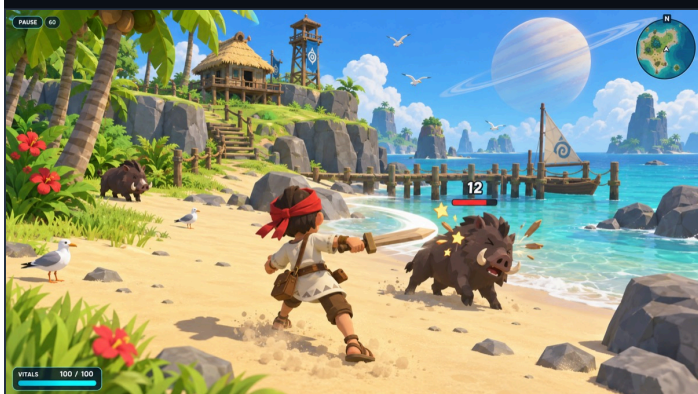

POI 1 · the Lookout

POI 2 · Wreck Cove

POI 3 · the Ring Shrine

Wooden sword swing, 12 dmg

Iron sword swing, 28 dmg

JAKE · 00:41

Show me the mockups

JAKE · 00:44

Which of these low poly mockups do you think is the easiest to implement? It's going to be really hard to do high graphical fidelity. So we need a low poly art style that is easy for Opus 5 to do, easy for an indie developer — we need the easiest one. Also, super cute third person views — but this game engine is still first person. We're still going to use all the first person stuff from the Pinewood shard. First person, first person, first person.

CLAUDE

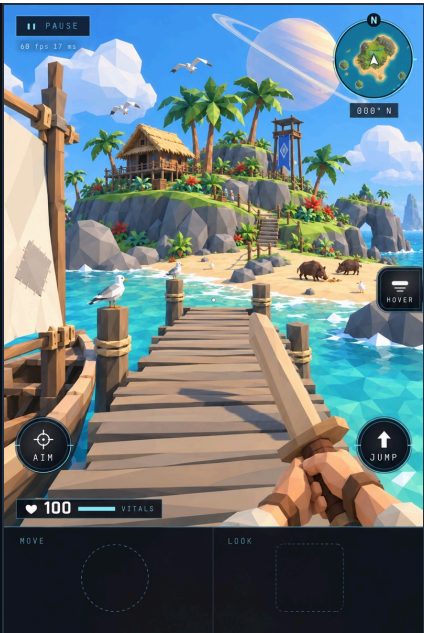

B is by far the easiest. No textures at all — every material is `MeshStandardMaterial({ flatShading, vertexColors })`. Everything is procedural geometry, which is how this engine already works (trees, animals, cabins are built in code). No new render passes — toon needs an outline pass that fights CSM/AO/bloom; painterly is our PBR pipeline with hand-painted textures. 60 fps on the phone for free. And understood: first person, same player/crossbow/HUD code as Pine Hollow.

JAKE · 00:46

I think this art style is the closest to what we want. But remember, this game is portrait. Go find the UI from Pinewood — we're going to have the same UI, the same minimap, the same pause menu button on top, the same black bar at the bottom for the touch controls. We're not going to have ammo count, but a lot of the HUD features are the same.

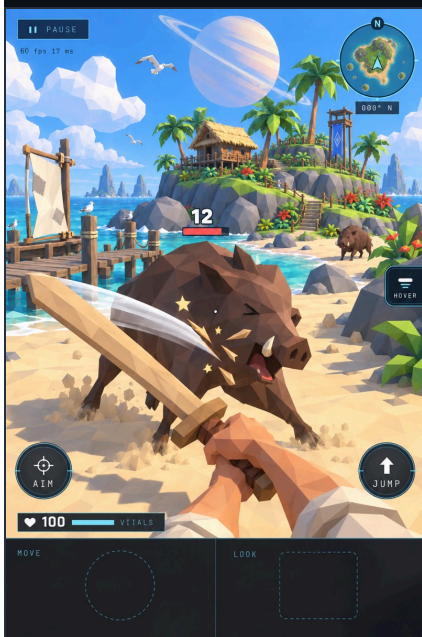

"This is the HUD" – Jake's phone capture of Pine Hollow, attached as the layout reference for the next round.

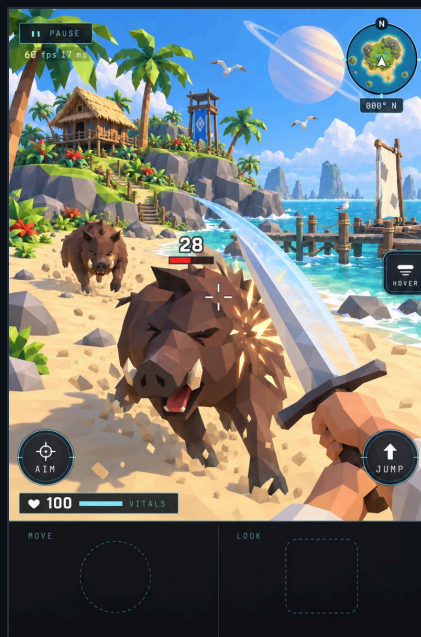

Mockup round 2: first person, portrait, style B, the real HUD, no bolt counter, wooden sword viewmodel.

00:47 — mockup round 2

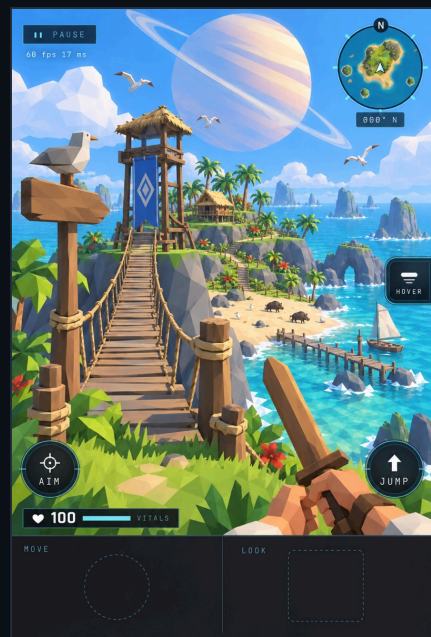

FIRST PERSON · PORTRAIT · STYLE B · THE REAL HUD

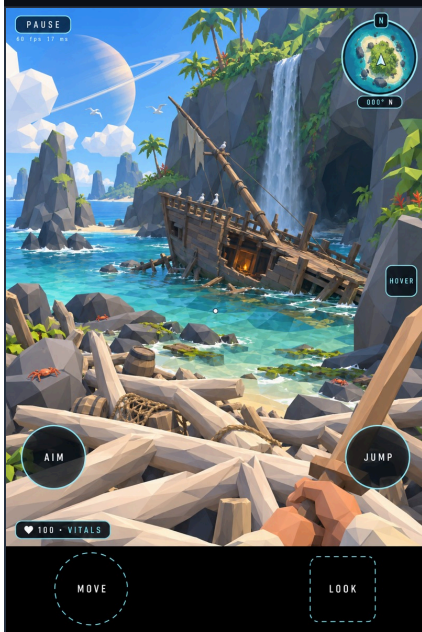

Wooden sword swing on the low-poly boar

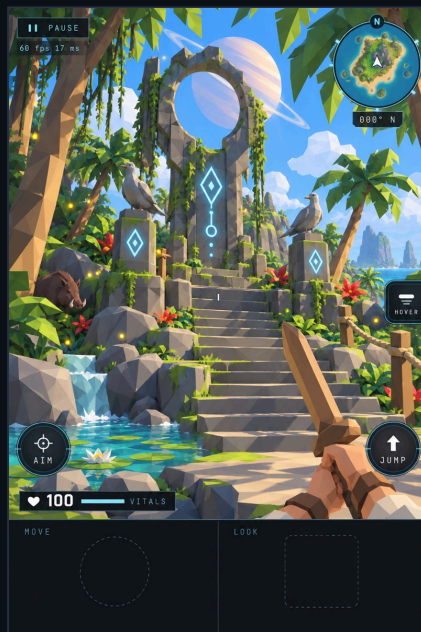

Iron sword overhead slash

The Lookout

Wreck Cove

The Ring Shrine

The full top-down map — became the island's actual layout plan

JAKE · 00:50

The points of interest on the map are fucking amazing. Because we have a mini map, I need you to render the full top-down map. Full map, as a render from ChatGPT.

01:00 — go

THE PLAN, THE AGENTS, THE ORDER

JAKE · 01:00

Those mockups look great. Go ahead and implement it, incrementally, where you can give me screenshots along the way. Just go ahead and implement this whole thing. Try and get some kind of basic thing where I can walk around going quickly. Focus on the map first, focus on the world, focus on me walking around.

JAKE · 01:02

One sub agent for the boar, one sub agent for the sword, one sub agent for the world. To get the world going really fast, let's fill the world with water and just put the pier. Not the island, just a pier. I start on a fucking pier.

JAKE · 01:04

Once the pier is built, then you can build a little boat next to the pier. And once the boat is built, then start building the island. The island's a huge thing, but you can build it piece by piece. What do you see directly from the pier? The beach. So just build the beach first, and then the rest of the island.

JAKE · 01:07

It's just water here, so spawn a sub agent to implement the whole swimming mechanism. And then a second sub agent afterwards that implements the diving mechanism: when you're in the water there's no jump button, there's a dive button. Keep diving really simple — when you press the dive button a second button appears next to it, the surface button. As long as you press dive you go down, if you press surface you go up.

Four agents launched at 01:10 with disjoint file sets — world (ocean, pier, then boat → beach → island), sword (a [Weapon](#) interface + the wooden sword), boar (`style: 'lowpoly'` on the animal factory), swim (Player.ts). I owned `main.ts`, the plan doc, the ask ledger and every deploy. Shared cross-cutting fields (`style`, `weapon`, `ocean`) went into `ChunkDef` before they started so nobody would collide there.

JAKE · 01:14

How close until we can deploy something?

JAKE · 01:18

Make a screenshot

JAKE · 01:19

I want to race to the fastest checkpoint with the sword, pier and that's it. Even a half broken demo — just mark that world as super experimental.

JAKE · 01:20

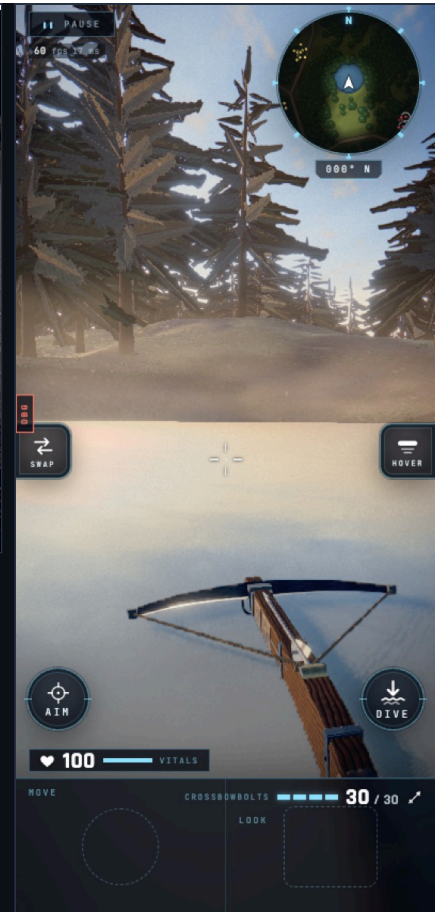

I mean keep building everything after the very first deployed checkpoint lol

JAKE · 01:22

Send me progress screenshots if you have any

boar-agent, 01:22: the first low-poly boar — same skeleton and AI, no fur shells, flat facets

swim-agent, 01:22: swimming in the Pine Hollow pond, DIVE replacing JUMP

JAKE • 01:24

What else, based upon the mockups and the idea, should we be building? I just started with the basic stuff — maybe I'm missing a bunch of other stuff.

CLAUDE

Gulls (in every frame), the ringed planet, the sailboat, palms, the thatched hut, fences/steps/signposts, the lookout + a walkable rope bridge, Wreck Cove with a glow inside → the iron sword, the Ring Shrine as the island's "why", the full map with POI labels; gameplay it implies: boar hit-stun for melee, a progression hook (wooden → iron), something to dive for, an answer for the chunk edge over water; presentation: style-B hero art, loading copy, island audio, the SUPER EXPERIMENTAL tag.

JAKE • 01:26

When you're swimming there's no weapons, there's hands. We need really simple animations for swimming with hands. Pine wood and driftwood have different art styles so they need different hand styles. And if hands are challenging, which I think they are, let's make the hands have white gloves at all times — that reduces some of the technical challenge of rendering hands.

swim-agent: white-gloved hands mid-stroke (Pine Hollow, smooth-shaded)

swim-agent: the faceted gloves over the ocean, off the pier

01:28 — "LET ME IN"

THE PLAN DOC, AND THE CHECKPOINT RACE

JAKE · 01:29

I'm gonna ask you in docs/plans to make the plan for Driftwood. Goals: flying gulls, low poly bird system — fantastic. You have to add the planet. Sailboat — I want that. Palms — I want that. A hut, fences, steps, signpost, rope bridge — yep. Wreck Cove, go nuts bro. Ring Shrine, go nuts bro. We have a full map already. Sword combat: no block, no dodge — you can try and strafe for dodging, otherwise you just eat the hit. When you're fighting with the sword maybe there's two or three swinging animations, not the same one over and over: a three-hit combo, tap tap tap. Progression hook: the whole point of Project Wildshard is that you can find equipment on the floor — hide the iron sword on this map; for simplicity it's a really cool big iron sword hovering above the ground, walk to pick me up. Diving: just decorative stuff on the water, coral. Swim forever, no drowning. Chunk edge over water: same chunk edge, it just goes underwater too, like a force field. Hero art in the menu selector: style B. Loading screen, audio, super experimental tag. Just put all that in the plan — because you're gonna build the whole plan overnight, right? I'm just waiting to play something, anything of this world. I just want to see how quickly I can get a new shard playable, and then I'll play the full shard tomorrow. How close are we to deploying the super experimental shard for ocean and pier? Show me screenshots.

→ docs/plans/DRIFTWOOD.md: checkpoints C0–C15, the sword rules, the water rules, the layout from the map, agent ownership.

JAKE · 01:33

No, dude, I want to see progress photos. There's plenty of CPUs on this machine. Just add a feature to the browser daemon that when the developer really wants to take a screenshot, you get one more browser for the screenshot.

JAKE · 01:36

Where's my wooden sword and world photos? The boar is cute, the swimming is cute, but the wooden sword is what I'm excited about, and the world is what I'm most excited about, bro. The fucking world.

JAKE · 01:37

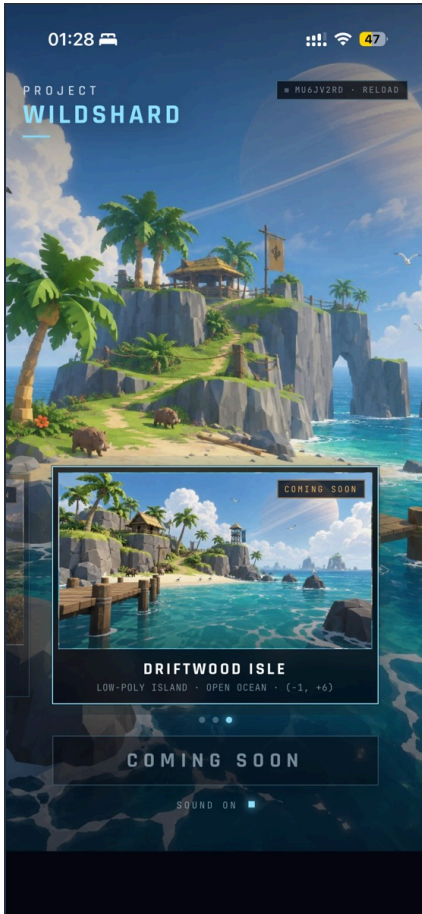

lol where

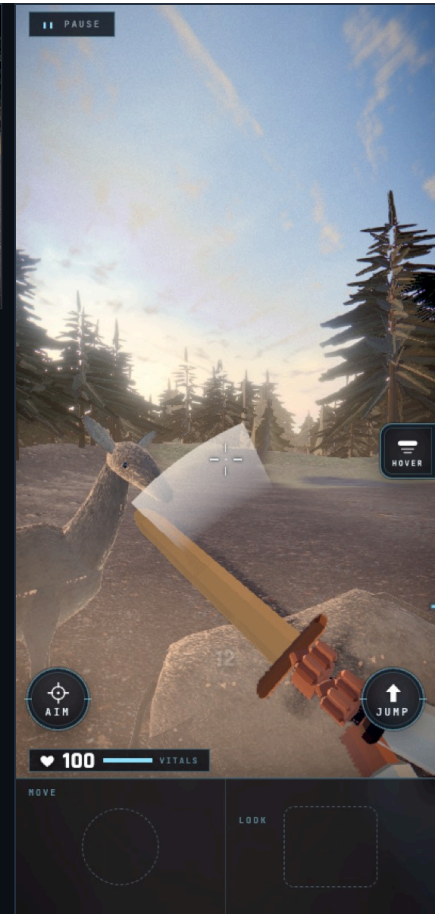

THE WORLD, 01:38 — the swim-agent's shot of the real build: the pier over the faceted ocean at 60 fps (crossbow still in hand)

THE SWORD, 01:41 — mid-slash, arc trail, a 12 on a boar (Pine Hollow test)

The wooden sword at rest

The portrait swing, no BOLTS panel

01:28 — "LET ME IN." Jake's phone: the deck still says COMING SOON.

JAKE • 01:28
LET ME IN.

JAKE • 01:39
How close are we to deploying something? It looks like we're really close. We're just waiting for that sword.

JAKE • 01:40
We really need the world agent and the sword agent to be checkpoint agents — world v0.0.1 and sword v0.1. Once we deploy something, then we can build the rest of the world and the rest of the sword.

JAKE • 01:41
Show me the fucking sword, show me the sword, show me your sword, show me the sword.

01:45 — **first deploy** (build b-mu6lg86q): ocean, pier, wooden sword, swimming. The other Wildshard session had a rifle + weapon manager uncommitted in the shared checkout, so the checkpoint `main.ts` was built from HEAD and committed as a blob through a private git index — the pattern every later commit used.

JAKE • 01:50
I'm in and it's fucking good bro

01:50 — "do everything"

THE WHOLE PLAN, PLUS THREE NEW ENEMIES

JAKE · 01:52

Okay, now you finish the whole plan, right? Do everything for the shard. Right now the sword just has that one animation — it doesn't have the one-two-three, right swing, left swing, right swing, any combo. And obviously there's no island, it's just a pier in the water. Just build everything from the plan, all of it, including those three new enemy types I requested — boar, bear, and three bonus ones you figure out yourself. But yeah, it's fucking great.

JAKE · 01:55

Quick bug fix deploy please — the mini map of the map is Pinewood, fix the mini map and deploy that.

JAKE · 01:58

Aiming the sword doesn't make any sense — top 3 melee ideas to replace the aim button

CLAUDE

HEAVY (hold to charge, release an overhead), KICK/SHOVE (a stagger), LOCK-ON. Recommended HEAVY — it keeps the disc, adds the one thing the combo lacks.

JAKE · 02:00

Use the herdr skill to see the other two agents — they're working on menus, new enemies, picking up things on the floor. You can use that for the iron sword. If you want to put some low poly bears on the island, go nuts. Take the mega plan and add three new enemy types that you're excited about, that fit the style — mockups of three new enemy types.

JAKE · 02:03

Bro, whenever the deploy is done, you gotta let me know. I'm ready. I'm fucking born ready.

world-agent step 2: the sailboat moored at the pier

step 3: the beach

step 4a: the plateau + hut

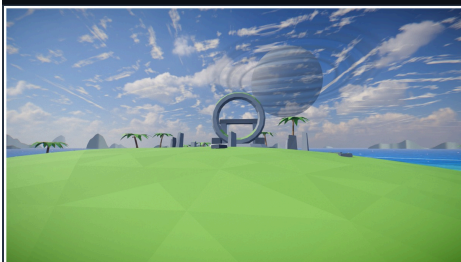

step 4b: palms

step 4c: the NE headland + lookout

step 4d: Wreck Cove

step 4e: the Ring Shrine

step 4f: hibiscus bushes + the N/W/E jetties

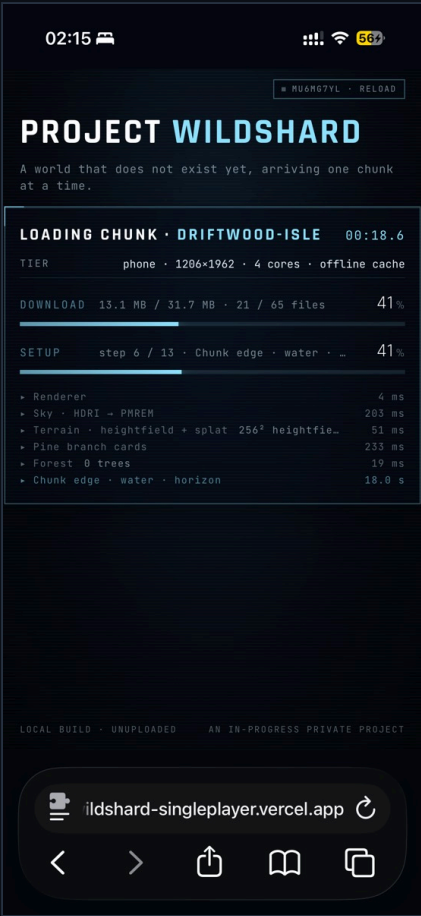

the island in the real build, 60 fps

02:14 — the phone crash

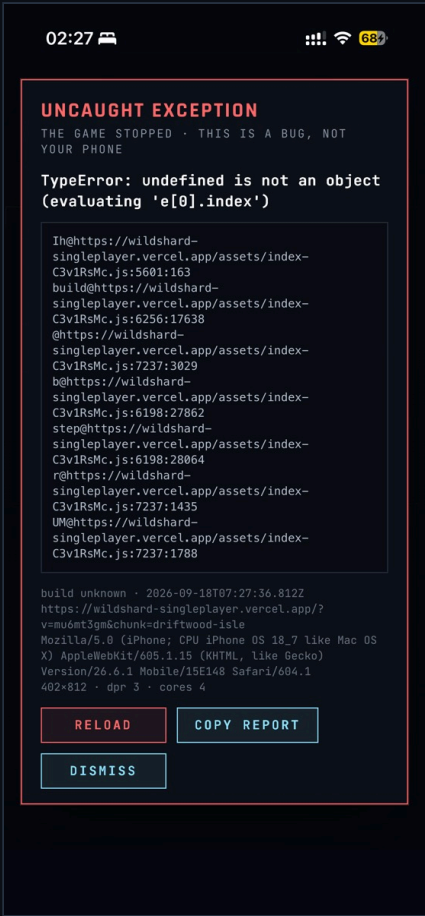

THE EXCEPTION MODAL, AND THE BUG IT FOUND

02:14 — "It's stuck loading"

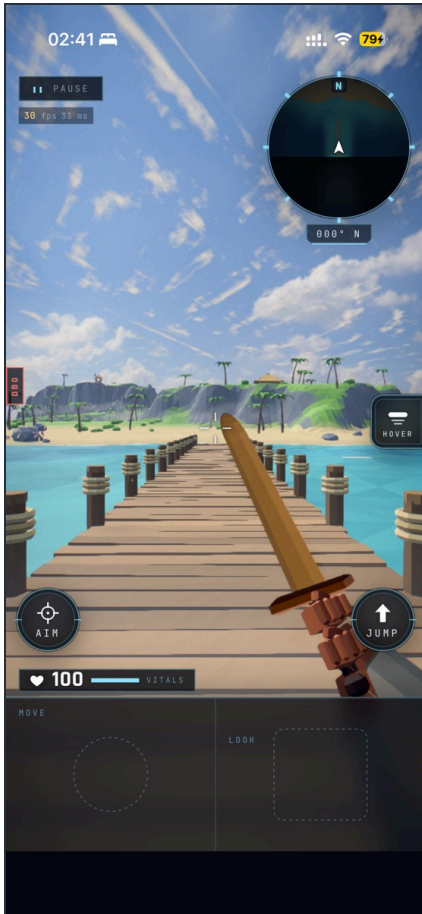

02:15 — "I feel like it's stuck on download"

02:27 — the uncaught-exception modal Jake asked for, catching it: e[0].index

JAKE · 02:14
It's stuck loading
JAKE · 02:15
I feel like it's stuck on download
JAKE · 02:20
Deploy the error state
JAKE · 02:21
Add more error states — add an uncaught exception modal
JAKE · 02:24
Need source maps for errors?
JAKE · 02:36
Where's the bug fix deploy

The modal shipped at 02:25 and the phone reported `TypeError: undefined is not an object (evaluating 'e[0].index')` — `mergeGeometries([])`: nothing to merge because every palm candidate was rejected because the terrain was flat sea floor because the service worker had migrated a **stale same-size terrain.bin** bake from the previous build (its cache name only changes when a file's size changes). Fix 1 (02:35): never migrate `/assets/baked/**`. Still crashed — the stale entry was already in the current cache. Fix 2 (02:40): purge cached bakes on activate, serve them network-first. Plus `minifyIdentifiers: false` so phone stacks are readable, and the world-agent made the bake self-validating (a landscape hash) and the scatterers tolerant of an empty list.

02:41 – "I'm in thanks." The pier, the sword, the island, the phone HUD, 30 fps (the perf pass came an hour later).

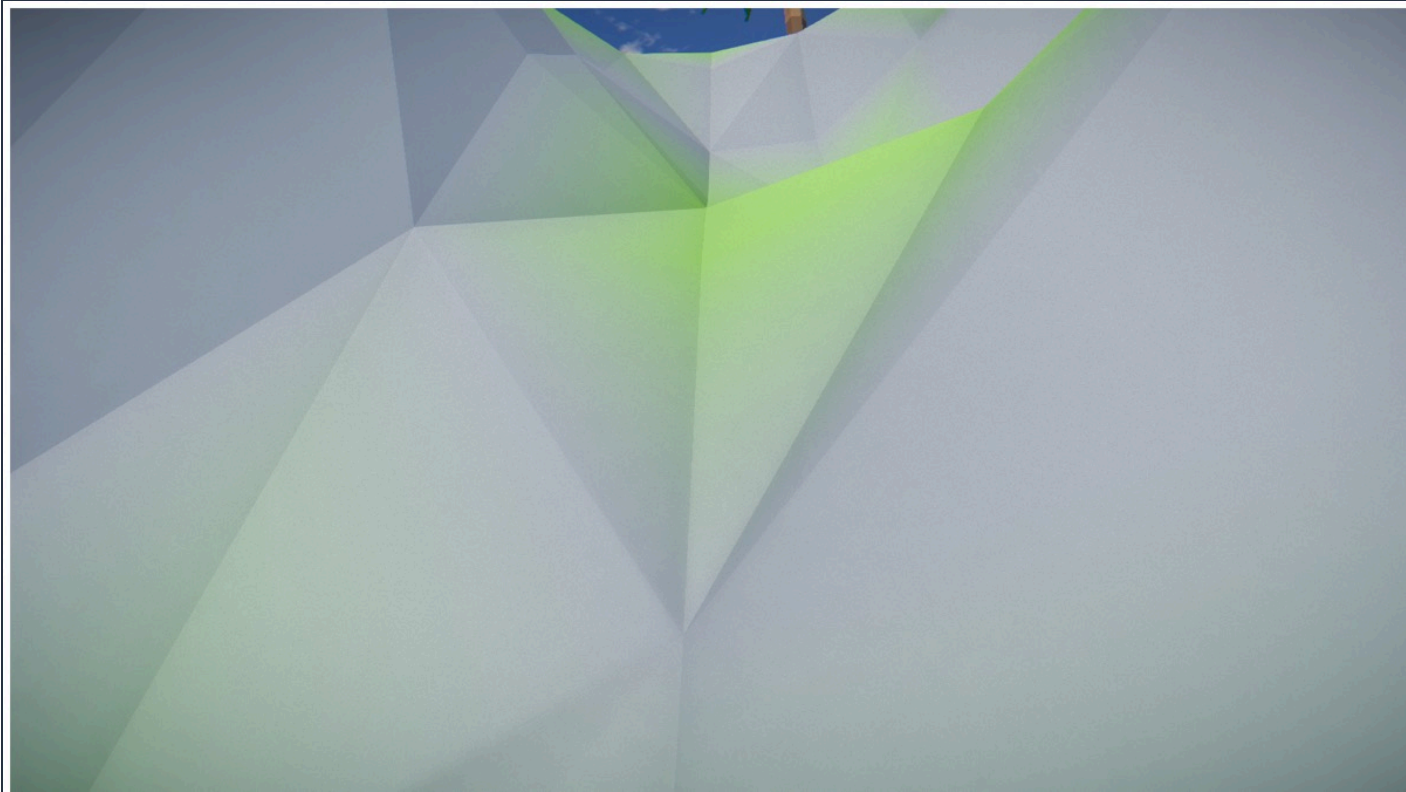

The island on the phone tier after the perf pass: 607k → 323k triangles, 60 fps

JAKE · 02:41

I'm in thanks.

JAKE · 02:44

You can't just walk up a cliff bro. Sure the hoverboard can magic glide up a cliff. But the cliffs and rocks and terrain here should stop you from being able to run up arbitrary walls or inclines.

dive-agent: walking into the plateau crag – stopped at the face, slides along the contour; >53° slides you down. Hoverboard exempt.

02:50 – the enemies

THREE NEW TYPES, CHOSEN TO FIT THE STYLE

Reef Crab – tidepools, sidesteps, hard shell (flank it)

Coconut Monkey – palm troops, throws coconuts (the only ranged attack; strafe)

Drowned Sailor – rises in the wreck's hold, guards the iron sword

03:00 → 04:23 – the rest of the plan lands

COMBO · GULLS + PLANET · AUDIO · DIVE · LOOT · FENCES · BRIDGE · ENEMIES

combo 1 · slash

combo 2 · backhand

combo 3 · overhead finisher

HEAVY · hold to charge (the old AIM disc)

HEAVY · release: 24, the boar shoved back and stunned

HEAVY on the phone

ambient-agent: gulls on the posts, flocks wheeling

a flock against the ringed gas giant

the planet on the phone

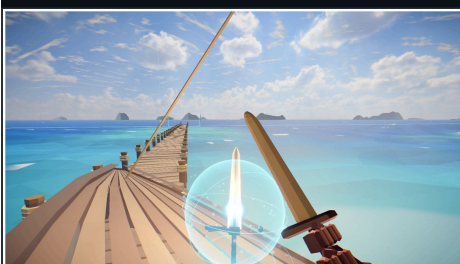

plank stairs + rope fences up the crag (the mockup's stairs)

the swaying rope bridge over the tidal creek

boars on the beach

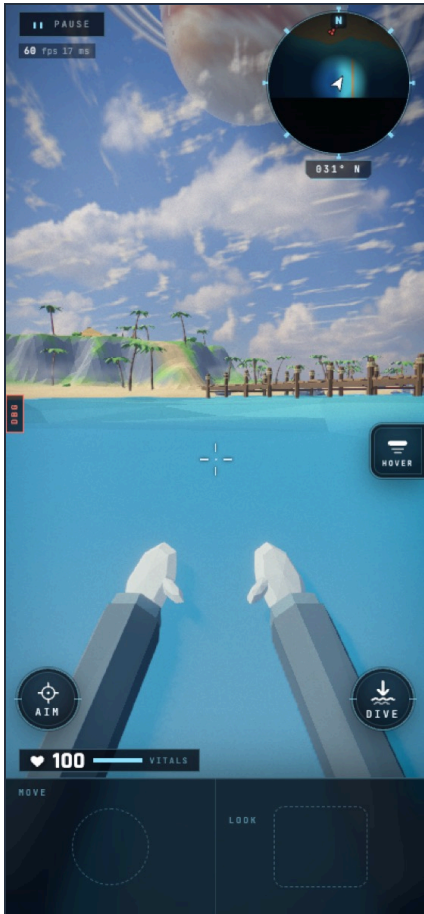

the iron sword hovering in its orb on the wreck deck

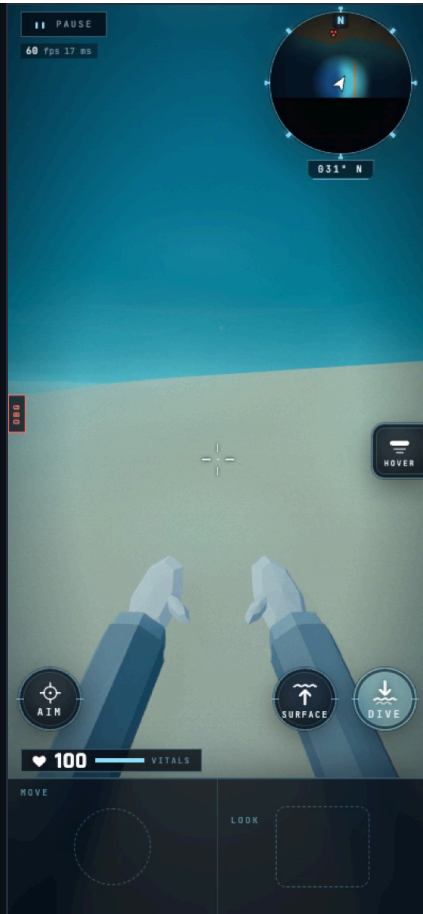

walk into it: IRON SWORD ACQUIRED

the brown bear at Wreck Cove

swimming: DIVE

submerged: DIVE + SURFACE

the coral reef + fish school you dive to

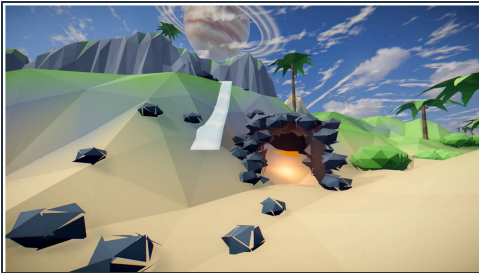

reef crabs at the tidepools

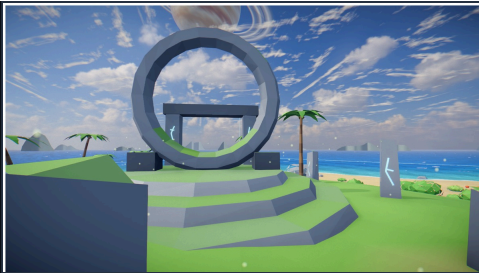

a coconut monkey mid-throw

the drowned sailor rising on the wreck deck

Wreck Cove: cascade + the glowing cave mouth

the shrine's glyphs + fireflies

the crab on the phone tier, 60 fps

JAKE · 04:30

What's the progress

CLAUDE

Done. Every checkpoint C0–C16 is live — build b-mu6r3wl0, 129 commits, 25 deploys.

Deploys

EVERY PRODUCTION BUILD THAT NIGHT

TIME	BUILD	WHAT WENT LIVE
01:45	b-mu6lg86q	ocean + pier + wooden sword + swimming (checkpoint C0/C1)
02:05	b-mu6m6qsv	boat, beach, boulders, hut, palms, island minimap, gloved hands, sword sounds
02:13	b-mu6mg7yl	palms + lookout wiring restore (after a stale-index revert)
02:25	b-mu6mvkt2	the uncaught-exception modal, lookout, wreck
02:35	b-mu6n8rr.i	SW never migrates bakes; readable stacks; shrine, jetties, bushes
02:40	b-mu6nepgr	SW purges cached bakes on activate (the crash fix that stuck)
02:45	b-mu6nlj77	minifyIdentifiers off, real build id in the modal
03:01	b-mu6o5sw7	three-hit combo + HEAVY + boar hit-stun, gulls, planet
03:04	b-mu6oad0g	menu scroll fix + legendary drops (other sessions), enemy mockups
03:17	b-mu6oq69o	island audio, planks/sand footsteps, stairs, fences, signposts, phone perf pass
03:24	b-mu6ozch8	the rope bridge
03:27	b-mu6p41p4	dive / surface, coral seabed, the cliff slope limit
03:45	b-mu6pqy9v	iron sword pickup, boars + bears + deer on the island, E jetty shortened
03:49	b-mu6pvvhg	in-engine hero art on the deck card
04:23	b-mu6r3wl0	reef crabs, coconut monkeys, the drowned sailor, cove + shrine dressing — the plan complete
08:14	b-mu6zc9vx	the trailers on the site; the original theme wired into the game

Not listed: ~10 intermediate builds. Three times a sibling session's plain `git commit` swept stale staged blobs from the shared index and reverted my wiring; every restore is in the log. Lesson (now in memory and in docs): in a shared checkout, commit through a private index pinned to a captured base.

The magic

WHY A FUN CHUNK IN FOUR HOURS — WRITTEN UP FOR MATTHEW IN DOCS/HOW-DRIFTWOOD-GOT-BUILT.MD

JAKE · 05:10

How come in this session we were able to build a really fun chunk in five hours? Matthew's working on the main game — multiplayer, hosted, chunk formats, upload server — trying to get a triple-A front end, and he's stuck in the wrong mode, ending up with uncanny slop. What's the magic of this standalone prototype, and of our collaboration, our pair programming, our steering?

1. **Pick the art style the engine hits at 100 %, not the one that looks best on a slide.** Style B was chosen because it was the easiest. 60 % execution reads as finished; photoreal punishes 95 %.
2. **Mockups are screenshots of the real game, with the real HUD.** Every agent had a picture to converge on and a definition of done that was not a sentence.
3. **Deploy the first checkpoint before it is good.** "Sword + pier, even half broken." The phone found the bug that mattered; the shard was playable three hours before it was done.
4. **Decide fast, in your own words, and mostly say no.** No block, no dodge, no drowning, no inventory, white gloves, decorative underwater, same HUD. Each "no" deleted a week.
5. **The engine is a kit; a shard is data plus a dozen small modules.** ~80 % recomposition. Save → HMR → screenshot in ten seconds; no infra tax on visual iteration.
6. **Parallel agents with hard ownership, one integrator.** Ten agents, disjoint files, mockup + harness + screenshot obligation each; one parent owning main.ts, the plan, the ledger, the deploys.
7. **Steer on feel, not implementation.** "Cute." "You can't just walk up a cliff." "Aiming a sword doesn't make sense." "It's stuck loading."

The trailer and the music

"2 MINS IS WAY TOO LONG — I WANT THE 15 S AND 30 S EDITOR'S CUT"

JAKE · 05:40

Lots and lots of building happened here. This is just a single player prototype towards the vision of Project Wildshard, which is going to be absolutely amazing and epic. Make me a trailer based upon this prototype — the gameplay of this game, towards that vision.

The 2:06 master, one frame every 6 s: title → the citadel vision → "every chunk built by a player" → Pine Hollow → Driftwood Isle → end card.
Captured deterministically: the game clock swapped for a fixed 1/30 s and the render loop gated to one frame per screenshot.

PROJECT WILDSHARD

A WORLD THAT DOES NOT EXIST YET, ARRIVING ONE CHUNK AT A TIME

PROJECT WILDSHARD

Build your chunk. Upload it. Play everyone's.

wildshard-singleplayer.vercel.app

Title card

End card

JAKE · 07:20

30s trailer is good. I need you to make a plan for our first original music — 30 s for this clip but we will also use it in game.

JAKE · 07:35

When the plan is done build it and show me the 15s and 30s trailer with original music.

The music is code, like everything else here. A D-Lydian theme written as data, seven WebAudio patches (drone, pad, pluck, marimba, bass, pulse, bell), an adaptive layer mixer (menu / calm / alert / combat / underwater + stings), one code path rendering offline for the trailer and playing live in the game. Cue points hit the cut exactly: pluck motif 3.5 s, marimba + bass on the pier 8.0, drums on the first sword swing 12.8, the minor turn when the sailor rises 21.5, the resolve chord on the hero shot 24.6. MIDI export for whenever a composer takes it further. Live at 08:14.

Appendix — the ask ledger

DOCS/TASKS/ASKS.MD, ROWS D1-D35: EVERY ASK, ITS STATUS, ITS EVIDENCE

#	ASK	STATUS	EVIDENCE
D1	"We are building Driftwood Island" — the low-poly Wind Waker–style island shard, currently a "not yet playable" teaser	open	this session; mockups first (D2-D4)
D2	Mockups via parallel codex agents: the spawn point in three different low-poly art styles	done	art/driftwood-spawn-{A-toon,B-faceted,C-painterly}.png (third-person round) – user: **B is closest** ; Claude: B is also by far the easiest (no textures, flat-shaded procedural geometry, no outline pass)
D3	Mockups of two or three points of interest	done	art/driftwood-poi-{1-lookout,2-wreck-cove,3-shrine}.png – user: "the points of interest are amazing"
D4	Island gameplay is different from Pine Hollow — "more like Zelda Wind Waker"; then: "this game engine is still first person" , same player/HUD code as Pine Hollow	done	first round was third-person (wrong); second round regenerated first-person
D8	Portrait, with the same HUD as Pine Hollow (PAUSE top, minimap, black touch bar at the bottom, no ammo counter) — user sent the real phone capture as the reference	done	art/driftwood-fp-{spawn,poi-1-lookout,poi-2-wreck-cove,poi-3-shrine,sword-wooden,sword-iron}.png (1024×1536, style B, HUD copied from the capture, no bolt counter)
D9	Full top-down map of the island as a codex render (what the minimap zooms out to), POIs on it	done	art/driftwood-map-topdown.png (1254², north up, 5 labelled POIs, 4 edge jetties)
D5	Equipment: mockups of a basic low-poly wooden sword and a basic low-poly iron sword ; one swing animation each (no shoot/reload); first implementation = wooden sword only	done (mockups)	art/driftwood-fp-sword-{wooden,iron}.png; implementation open under D1
D6	Where does equipment / inventory go in the UI — "forget about equipment ... I'll deal with inventory and equipment later"	dropped (deferred by the user)	–
D7	"We already implemented the boar — do the same boar in the low-poly art style, and start there"	open	first engine step after the mockups
D10	"Go ahead and implement the whole thing, incrementally, screenshots along the way; get me walking around quickly" — world first	in flight	parent + agents below
D11	One subagent each: boar (low-poly), sword (wooden), world	in flight	boar-agent, sword-agent, world-agent (parent wires main.ts)
D12	World order: fill the world with water + just the pier → then a little boat by the pier → then the beach (what you see from the pier) → then the rest of the island piece by piece	in flight	world-agent
D13	Swimming mechanism (subagent) — it's all water	in flight	swim-agent
D14	Diving (second subagent, after swimming): in water JUMP becomes DIVE ; holding DIVE goes down, a SURFACE button appears beside it that goes up; no other vertical control for now	open	starts when D13 lands
D15	"Race to the fastest checkpoint: sword + pier , even half broken; mark the world super experimental "; then keep building everything	in flight	parent: main.ts ocean/pier wiring; deploy once HEAD builds
D16	"What else should we be building?" — Claude's list from the mockups: gulls, ringed planet, palms, thatched hut , fences/steps/signposts, lookout + rope bridge, wreck cove (glow inside → iron sword pickup), ring shrine , full-map screen with POI labels, boar hit-stun for melee, boar senses retuned for open beach, something to dive for, ocean-edge boundary, hero/thumbnail in style B, island audio (waves/gulls/planks/sand/splash)	open	rows to be split out as they start
D17	Swimming = no weapon, hands only ; simple swim-stroke hand animation; different hand styles per shard (Pine Hollow PBR vs Driftwood low-poly); white gloves at all times to dodge hand-rendering difficulty	in flight	swim-agent (src/player/Hands.ts); parent hides the weapon while player.swimming
D18	Plan doc in docs/plans with everything decided: gulls, planet, sailboat, palms, hut, fences, steps, signpost, rope bridge, wreck cove + ring shrine ("go nuts"), sword combo (2–3 swings, three-hit combo, no block/dodge — strafe or eat it), iron sword hovering pickup, diving decorative only, swim forever / no drowning, same chunk-edge force field underwater, style-B hero art, loading screen, audio, SUPER EXPERIMENTAL tag; "build the whole plan overnight"	done (doc) / in flight (build)	docs/plans/DRIFTWOOD.md
D19	"LET ME IN" — deploy checkpoint C0/C1	done	4a7c034 built from a clean export, live at https://wildshard-singleplayer.vercel.app (build b-mu6lg86q): ocean + pier + wooden sword + swimming

D20	World/sword agents as checkpoint agents (world v0.0.1 / sword v0.1: commit the minimal, deploy, then keep building)	done	both committed WIP on request; world-agent continues boat → beach → island
D21	Use herdr to see what the other two sessions are doing (menus, floor pickups + pickup mockups, enemy variants / new enemy types) and reuse: floor-pickup for the iron sword; low-poly bears on the island; add three new enemy types that fit the style to the plan (+ mockups) — "go nuts"	open
